

Assisting Clients in the Conduct of Collections across Media, Geographies and Jurisdictions

Ledjit Data Collection

The conduct of data collection can present counsel - in-house and outside - with a multitude of challenges. Not only does one have to contend with a variety of document sources and media types, but also with issues such as document accessibility, multiple locations, and jurisdictional differences - including privacy laws and blocking statutes. Combine this with time pressures and the inherent challenge of understanding the technologies themselves and the challenges can quickly become too great even for the accomplished counsel and its team. Let Ledjit's consultants pave the way to defensible data collection projects.

Ledjit provides data collection services to corporations, governments and law firms. Ledjit's approach takes into consideration the factors of time sensitivity, data types and storage locations, collection approaches, as well as the applicable laws and best practices. As active participants in [The Sedona Conference Working Groups](#) (WG1 (USA), WG6 (Canada) and WG7 (International)) and the [EDRM](#), we are fully aware of the current and evolving legislative and statutory landscape. By combining both of these aspects with leading edge collection technologies and partners, Ledjit is able to provide corporations, governments and law firms with the best collections capability on the market today.

Collections can be performed at the client or data site, or remotely over a network. This last approach prevents the disruption and annoyances that generally accompanied onsite collection. The resulting document sets can then be hosted either on Ledjit's secure servers or on the client's own servers. Preliminary processing can be conducted on the document set to provide an early case assessment, i.e. a first look at relevance, and to test subsequent processing actions. The Ledjit collection team members are highly skilled in the use of collection technologies and techniques to ensure that the resulting document set is forensically and legally sound.

Features	Benefits
E-discovery collection experts trained in the latest technologies	No need to develop or train an in-house team and acquire the necessary equipment
Flexible staffing to meet case or client demands	Easily scalable and mobile team able to address rapidly changing requirements and multi-locational clients, teams and data repository
